                                                                                                                                                                                                                                                                                                                                                     receptor related protein, previously designated LRP-3). AAV85823 to AAV85900 represent SNP primers used for obtaining LRP5 cDNA. Nucleic acid molecules (NAMs) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMs or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapies that affect LRP5 may also be useful in the treatment of autoimmune diseases such as glomerulonephritis, diseases and disorders involving disruption of endocytosis and/or antigen presentation, cytokine clearance and/or inflammation, viral infection, pathogenic bacterial toxin contamination, elevation of free fatty acids or hypercholesterolemia, type 2 diabetes, osteoporosis, Alzheimer's disease and cardiovascular disease.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes LRP5 (low density lipoprotein (LDL) receptor related protein, previously designated LRP-3). AAV85897 to AAV85822 represent exon primers used for obtaining LRP5 cDNA. Nucleic acid molecules (NAMS) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (LDDM). The NAMS or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapise that affect LRP5 may also be useful in the treatment of autoimmune diseases such as glomerulonephritis, diseases and disorders involving disruption of endocytosis and/or antigen presentation, cytokine clearance and/or inflammation, viral infection, pathogenic bacterial toxin contamination, elevation of free fatty acids or hypercholesterolemia, type 2 diabetes, osteoporosis, Alzheimer's
               insulin dependent diabetes mellitus; autoimmune disease; glomerulonephritis; inflammation; viral infection; osteoporosis; hypercholesterolemia; Alzheimer's disease; low density liponrote. PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated LDL-receptor related protein - used to develop products treating, e.g. elevated triglyceride levels, diabetes, autoimmune disorders, inflammation or Alzheimer's disease.
                                                                                                                                                                                                                AAV85879

                                                                                                                                                                                                                                                                                                                                                                                                                                                               the treatment of autoimmune diseases such as glomerulonephritis, diseases and disorders involving disruption of endocytosis and/or antigen presentation, cytokine clearance and/or inflammation, viral infection, pathogenic bacterial toxin contamination, elevation of free fatty acids or hypercholesterolemia, type 2 diabetes, osteoporosis, Alzheimer's disease and cardiovascular disease. Products from the present invention can also be used for detection, diagnosis and drug screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes LRP5 (low density lipoprotein (LDL) receptor related protein, previously designated LRP-3). AAV85923 to AAV85900 represent SNP primers used for obtaining LRP5 CDNA. Nucleic acid molecules (NAMs) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMs or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapies that affect LRP5 may also be useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated LDL-receptor related protein - used to detreating, e.g. elevated triglyceride levels, diabetes, disorders, inflammation or Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              22-OCT-1998

PCR primers AAX86523-62 were used for amplification and sequencing of exons of the Rhesus D (RhD) antigen gene. The specification describes a RhD contributing to or indicative of the weak D phenotype, where the RhD polymucleotide carries at least one missense mutation as compared to the wild-type RhD, in its transmembrane and/or intracellular regions, especially in amino acid positions 2-16, 114-149, 179-225 or/and 267-397, with the proviso that the D antigen does not carry a single missense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is a PCR primer specific to human 7SL RNA. used to amplify human staufen (hStau) cDNA synthesised using ranhexamer primers and Superscript II reverse transcriptase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human staufen polypeptide useful inhibitors.

The probes and antibodies are useful in the methods for detection of weak D phenotypes. Red blood cells, from probands, are useful for the assessment of the affinity, avidity and/or reactivity of monoclonal anti-D antibodies, polyclonal anti-D antisera or of anti-globulin or anti-human-globulin antisera. Detecting the presence of the RhD associated with weak D phenotype is useful for determining that a patient in need of a blood transfusion is to be transfused with RhD negative blood from a donor. Alternatively, testing for weak D phenotype RhD in the blood of a donor is useful for determining whether the donor blood should be excluded for transfusion to patients having wild type RhD or weak D types, other than that of the donor have the donor blood should be excluded for the follow that a patient before the donor blood should be excluded for transfusion to patients having wild type RhD or weak D types, other than that of the donor weak D types and the type that the donor tha
                                             hyperproliferative gene expression. The antisense compound is used to treat an animal having a disease or condition associated with mdm2, particularly a hyperproliferative condition, more particularly cancer, especially of the blood, brain, breast, lung or soft tissue, or
                                                                                                                                                                                        AAZ37473-Z37738 represent human mdm2 phosphorothioate oligonucleotides.
AAZ37471, AAZ37472, AAZ37739, AAZ37740 and AAZ37741 are used in the exemplification of the present invention. The present invention describes novel nucleotide antisense compounds, targetted to the 5' untranslated, translation termination codon, or 3' untranslated region of a nucleic acid encoding human mdm2, that modulates expression of human mdm2. The oligonucleotides mediate their effect by antisense inhibition of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Miraglia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human mdm2 gene; proliferation; tumour; phosphorothioate; p53; cancer; antisense; modulation; oligonucleotide; expression; inhibition; hyperproliferation; blood cancer; brain cancer; breast cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  07-JAN-2000

                                                                                                                                                                                                   AAZ37473-Z37738 represent human mdm2 phosphorothioate oligonucleotides. AAZ37471, AAZ37472, AAZ37739, AAZ37740 and AAZ37741 are used in the exemplification of the present invention. The present invention describes novel nucleotide antisense compounds, targetted to the 5' untranslated, translation termination codon, or 3' untranslated region of a nucleic acid encoding human mdm2, that modulates expression of human mdm2. The oligonucleotides mediate their effect by antisense inhibition of hyperproliferative gene expression. The antisense compound is used to treat an animal having a disease or condition associated with mdm2, particularly a hyperproliferative condition, more particularly cancer, especially of the blood, brain, breast, lung or soft tissue, or psoriasis, fibrosis, atherosclerosis or restenosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       7716/c

                                                                                                                                                                                                                                                                                                                                   protein 5 isoform NUCPSSI encoding DNA sequence. UCP5 is involved in metabolism, and it may be involved in catalysing H+ leak, and therefore be involved in energetic inefficiency in vivo. The present invention relates to human and murine UCP5 nucleotide and protein sequences. There are three isoforms of human UCP5, hUCPSI, hUCPSS, hUCPSSI, and two isoforms of murine UCP5, mUCP5I and mUCP5S. The human UCP5 gene is located on chromosome 10q23-25. The nucleic acids encoding UCP5 can be used as hybridization probes, in chromosome and gene mapping, for the generation of antisense RNA and DNA and in the preparation of recombinant UCP5 proteins. UCP5 nucleic acids can be used in gene therapy for regulation of metabolic conditions. Upregulating or downregulating UCP5 activity in a mammal is used for modulating metabolic rate in the mammal, in particular upregulation of UCP5 activity stimulates an increase in markabolic rate in the mammal.
                                                                                                                                                                                        metabolic rate in an obese mammal. Other therapeutic applications associated with modulating UCP5 activity are treating symptoms associated with stroke, trauma (e.g. burn trauma), sepsis and infection. Detecting UCP5 activity can be used to assist predictions concerning metabolic conditions or risk for onset of obesity and as UCP5 may control the generation of reactive oxygen to diagnose impaired neural activity or neural degeneration. Anti-UCP5 antibodies can be used in diagnostic assays and for the affinity purification of UCP5 from recombinant cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAA28013 standard; DNA; 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Uncoupling protein 5; UCP5; metabolism; chromosome 10q23-25; H+ leak; metabolic rate; obesity; stroke; trauma; burn trauma; sepsis; infecti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Uncoupling protein isoform UCP5SI nucleotide sequence PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   29-AUG-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Homo

                                                                                                                                                                                                                                                                                                                                                                       CC in length, targeted to a nucleic acid encoding a human MDMX.

CC specifically hybridizes with and inhibits the expression of human MDMX.

CC specifically hybridizes with and inhibits the expression of human MDMX.

CC file products of the invention have anticarcinogen, antiinflammatory and

CC antiinfectious activity. Synthesized chimeric oligonucleotides targeted

CC to human MDMX, 20 nucleotides in length, composed of a central gap region

CC consisting of ten 2'-deoxynucleotides flanked on both sides by 5-

CC nucleotide wings were tested for antisense inhibition of MDMX expression.

CC Results of real-time quantitative polymerase chain reaction (PCR) showed

CC 10 out of the 159, 20 base pair sequences, all fully defined in the

CC specification, demonstrated at least 30% inhibition of MDMX expression.

CC modulation, particularly inhibition of MDMX expression.

CC modulation, particularly inhibition of MDMX expression, and may be used

CC disease or condition associated with expression of MDMX. The antisense

CC oligonucleotides may also be used as research reagents or kits, and as

CC distinguish between functions of various members of a biological pathway,

CC and as prophylaxis, e.g. to prevent or delay infection, inflammation or

CC tumor formation. AAA11781-AL1945 represent antisense oligonucleotides
                                                                                                                                       Matches

                                                                                                                                                                                                                                                                                                                                       The present sequence is a primer 2C12502 used for sequencing a cDNA CC corresponding to an expressed sequence tag identified in a human lung CC library, to obtain full length clone of polynucleotide encoding stomach CC protein zsig28. The zsig28 gene is located at 3g22.1-3g22.2 region of CC human chromosome 3. The zsig28 protein shows homology to a diverse family CC murine oligodendrocyte-specific protein (OSD) and rat androgen-withdrawal CC apoptosis protein RVP.1. It is thought to be a cell-cell signalling CC molecule, a growth factor receptor or extracellular matrix associated CC protein with growth factor receptor or extracellular matrix associated CC apoptotic cellular pathway. The protein may act as an anti-microbial CC agent and may bind toxins produced by bacteria which cause food CC agonists are useful for promoting apoptosis in cells over-expressing CC asig28 e.g. in cancer cells. They are also useful for stimulating cell CC growth or differentiation. Altered levels of zsig28 protein in a test CC sample such as saliva, serum, sweat or biopsy can be monitored as an CC indication of digestive function, gastric ulcer or cancer. zsig28 CC expression can be used as a differentiation marker to determine the stage of tumour or cell maturity, particularly in epithelial cells. CC polynucleotides encoding zsig28 can be used in gene therapy applications cc. in the protein and cancer in the test contracts of the protein service.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is one of a number of antisense compounds of 8 to 30 nucleobases in length that have been designed to target a 5'untranslated region, start codon, coding region of antiranslated region of the human receptor activator of NF-kappaB (RANK). The antisense compounds specifically hybridise with and inhibit the expression of RANK. The antisense oligonucleotides are useful for inhibiting the expression of human RANK in human cells or tissues. They can be utilised for diagnostics, therapeutics for the treatment of diseases associated with the expression of RANK, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, and as research reagent. The antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel antisense compounds capable of modulating expression of human receptor activator of NF-kappaB useful for diagnosis, prophylaxis and treatment of diseases associated with expression of RANK.
                                                                                                                                                                                                                                   Human; cytostatic; receptor activator
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; cytostatic; antiinflammatory; antisense oligonucleotide; cancer; receptor activator of NF-kappaB; RANK; infection; inflammation; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                               region, start coding region or 3'untranslated region of the human receptor activator of NP-kappaB (RANK). The antisense compounds specifically hybridise with and inhibit the expression of RANK. The antisense oligonucleotides are useful for inhibiting the expression of human RANK in human cells or tissues. They can be utilised for diagnostics, therapeutics for the treatment of diseases associated with the expression of RANK, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, and as research reagent. The antisense compounds are safely and effectively administered to humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel antisense compounds capable of modulating expression of human receptor activator of NF-kappaB useful for diagnosis, prophylaxis and treatment of diseases associated with expression of RANK.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Baker BF,

                                                                                                                                                                                      length targetted to a nucleic acid encoding glycogen synthase kinase 3 alpha. The antisense compound specifically hybridises with and inhibits the expression of glycogen synthase kinase 3 alpha. The antisense compound is useful for the treatment of a diseases associated with glycogen synthase kinase 3 alpha such as diabetes, a neurological disorder, a haematopoietic disorder, a hyperproliferative disorder or a developmental disorder. The antisense compounds may also be used prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence is a phosphorothicate antisense oligonucleotide targetted to human glycogen synthase kinase 3 alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            modified_base
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antisense compound 8 to 30 nucleobases in length comprising a that is targeted to a nucleic acid molecule encoding glycogen kinase 3 alpha, useful for the treatment of e.g. diabetes and hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          modified_base

The invention relates to an antisense compound 8 to 30 nucleobases in length targetted to a nucleic acid encoding glycogen synthase kinase 3 alpha. The antisense compound specifically hybridises with and inhibits the expression of glycogen synthase kinase 3 alpha. The antisense compound is useful for the treatment of a diseases associated with glycogen synthase kinase 3 alpha such as diabetes, a neurological disorder, a haematopoietic disorder, a hyperproliferative disorder or a developmental disorder. The antisense compounds may also be used prophylactically to prevent or delay infection, inflammation or tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       antisense therapy; diabetes; hyperproliferative disorder; inflamma neurological disorder; tumour; haematopoietic disorder; infection; hyperproliferative disorder; developmental disorder; antisense;

                                                                                                                                                                                                                                                                                                     The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA length clones were obtained by construction of full length enriched cDNA interface that were contacted by the cDNA construction of the protein encoded by the cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           genomic DNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (-ITHH)
                                                                                                                                                                                                                                          libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a primer used to amplify a human cDNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides a database of human samples obtained from healthy individuals which can be used to identify polymorphic genetic markers. Data obtained for the database can be used to sort the samples by parameters such as age, sex and ethnicity. This is useful in linking markers with diseases, susceptibility to infection and drug responses. The present primer was used in an assay to demonstrate the uses of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         producing a database for identifying polymorphic genetic markers, comprises obtaining data relating to members of a healthy populat entering the information into a database.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human AKAP10 coding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a method for treating a patient diagnosed as having a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, involving administering a compound that modulates LXR- or RXR-mediated transcriptional activity or ABC1 expression or activity. The LXR gene product may be used in an assay to identify compounds useful for the treatment of a disease or condition selected a lower than normal HDL cholesterol level, a higher than normal LDL cholesterol level, a higher than normal triglyceride level, and a cardiovascular disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treating a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, by administering a compound that modulates LXR- or RXR-mediated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               01-SEP-2000;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure; Fig 3; 317pp; English.

PCR primers AAH27888-AAH28055 represent PCR primers used to amplify identify minimal deletions in the human FRA16D oxidoreductase (FOR)

and gene

Example 1; Page 46; 150pp; English.

Novel isolated 16q23.2 nucleic acid molecule, FRA16D oxidoreductase gene associated with FRA16D site, useful for early diagnosis and assessment of risk of cancers associated with the FRA16D region.

The FRA16D site is a great ragile site induced by aphidicolin, which is located within the FOR gene. The fragile site is the location of breakpoints of a variety of chromosomal rearrangements, and other mutations associated with cancers. The FOR protein is expressed as a number of splice variants. FOR gene polynucleotide fragments are capable of acting as specific primers or probes for detecting cancer associated variations of DNA sequence such as a point mutation or small DNA rearrangement associated with the tumour, a breakpoint of one or more chromosomal rearrangements associated with the tumour and a pause site within the FRA16 gene. FOR nucleic acid molecules are useful as markers to identify relationship between the fragile site (FRA16D) and the DNA instability in neoplasia which allows better
     The present invention relates to an antisense compound 8-30 nucleobases in length targeted to nucleobases 1-308 of the 5' untranslated region, 1776-1806 of the translation termination codon region or 1818-2370 of the 3' untranslated region of a nucleic acid molecule encoding human mdm-2.
                                                                                                                                                                                                  Novel antisense compound 8-30 nucleobases in 10 acid molecule encoding human mdm-2 useful for mof human mdm-2 and reducing hyperproliferation

                                                                                                                                   The present invention relates to an antisense compound 8-30 nucleobases in length targeted to nucleobases 1-308 of the 5' untranslated region, 1776-1806 of the translation terminon codon region or 1818-2370 of the 3' untranslated region of a nucleoic acid molecule encoding human mdm-2. The invention is useful for reducing hyperproliferation of human cells, modulating the expression of mdm2 in human cells or tissues or in vitro.
                                                                                                                                                                                                                                              Novel antisense compound 8-30 nucleobases in length targeted to a nucleic acid molecule encoding human mdm-2 useful for modulating the expression of human mdm-2 and reducing hyperproliferation of human cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention is useful for reducing hyperproliferation of human cells, modulating the expression of mdm2 in human cells or tissues or in vitro. The hyperproliferative disorder includes cancer or psoriasis

The PCR primers are used to amplify a colligonucleotides of the invention. The PCR primers are used to amplify a colligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence, absence or colligonucleotides are useful for determining the presence, absence or colligonucleotides are useful for determining the presence, absence or colligonucleotides are useful for determining the presence, absence or colligonucleotides are useful for determining the presence, absence or colligonucleotides are useful for determining the presence, absence or colligonucleotides are useful for determining the presence, absence or colligonucleotides are useful for determining the presence, absence or colligonucleotides are useful for determining the presence of colligonucleotides are useful for determining the presence of colligonucleotides are useful for determining the presence or colligonucleotides are useful phenotypic trait suspected of being cased by one or more SNPs. Phenotypic traits include diseases e.g. colligonucleotides and acute intermittent porphyria. Phenotypic colligonucleotides are susceptibility to multifactorial colligonucleotides are susceptibility to multif

Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide CC primer extension (SNPE) primers, and the sequences of regions flanking CC sites of single nucleotide polymorphisms SNPs. The present invention CC includes kits for determining the presence or absence of a SNP, using the CC oligonucleotides of the invention. The PCR primers are used to amplify a CC performing a single-nucleotide primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by CC performing a single-nucleotide primer extension reaction. The CC individuals, having a pathological phenotypic trait suspected of being CC assess by association analysis the genotype of an individual or group of cc individuals, having a pathological phenotypic trait suspected of being CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular CC dystrophy, familial hypercholesterolaemia, polycystic kidney disease, cc craits also include symptoms of or susceptibility to multifactorial CC disease of which a component is or may be genetic such as autoimmune cd iseases, including, rheumatoid arthritis, multiple sclerosis, cancer, nervous system diseases and infection by pathogenic CC microorganism. The method is also useful in forensic investigations and ccc for a human SNP containing DNA sequence represents a PCR primer specific ccc for a human SNP containing DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Single nucleotide polymorphism; SNP; single nucleotide primer extension; SNPB; genotyping; agammaglobulinaemia; diabettes instpidus; cancer; Lesch-Nyhan syndrome; muscular dystrophy; familial hypercholesterolaemia; polycystic kidney disease; osteogenesis imperfecta; autoimmune disease; acute intermittent porphyria; rheumatoid arthritis; multiple sclerosis; inflammation; forensic investigation; paternity analysis; PCR primer; ss.

                                                                                                                                                                                                                                                                                     Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide CC primer extension (SNPB) primers, and the sequences of regions flanking CC sites of single nucleotide polymorphisms SNPs. The present invention CC includes kits for determining the presence or absence of a SNP, using the CC includes kits for determining the presence or absence of a SNP, using the CC SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by CC performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence, absence or CC identity of a SNP and for genotyping nucleic acid samples for eg. to assess by association analysis the genotype of an individual or group of CC individuals, having a pathological phenotypic trait suspected of being CC auseed by one or more SNPs. Phenotypic traits include diseases e.g. CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular CC osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial CC disease of which a component is or may be genetic such as autoimmune inflortence of a component is or may be genetic such as autoimmune conficer nervous system diseases and infortion by nathogenic conficer nervous system diseases and infortion by nathogenic conficer nervous system diseases and infortion by nathogenic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a composition of mammalian myeloid progenitor cells, where at least 95% of the cells are characterised as ckit (CD117 protein), IL-7Ralpha+ (interleukin-7 receptor alpha) and lin-(lineage negative). The composition is useful in transplantation, experimental evaluation, and as a source of lineage and cell specific products, including mRNA species useful in identifying genes specifically expressed in these cells, and as targets for the discovery of factors or

APEX-1 and APEX-2 comprise an CC extracellular domain having one immunoglobulin (1g)-like structure and N-CC glycosylation site, a transmembrane domain, and a cytoplasmic domain CC having at least one SH2-binding motif. APEX proteins and antibodies are CC useful in the study, diagnosis, prevention and treatment of disease CC arteriosclerosis, AIDS, cirrhosis, Crohn's disease, atopic dermatitis, CC autoimmune anaemia, bursitis, cholecystitis, diabetes mellitus, CC emphysema, atrophic gastritis, inflammatory bowel disease, multiple costeoarthritis, osteoporosis, myocardial or pericardial inflammation, osteoporosis, myocardial or pericardial inflammation, CC graft rejections, graft versus host reaction and systemic lupus CC graft rejections, graft versus host reaction and systemic lupus CC erythematosus. APEX proteins are useful as diagnostic and/or prognostic CC markers on APCS or APEX expressing cells, the ability to elicit the CC generation of antibodies and as targets for various therapeutic modalities. APEX proteins are also useful for identifying and isolating
                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                      S

(I) is useful for treating a human having a disease or condition associated with (II) such as premature aging or a hyperproliferative disorder especially cancer, by inhibiting the expression of (II) in human cells or tissues. (I) is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Key

                             S
                                                                                                                               cc length targeted to the 5' untranslated region, translation termination cc codon region, 3' untranslated region, coding region or translation start csite of a nucleic acid encoding human mdm2, where the antisense compound cc modulates the expression of human mdm2. The antisense oligonucleotides of the invention are useful for encoding human mdm2 and for inhibiting the expression of human mdm2. They may be used for treating an animal having cd disease or condition associated with amplification of mdm2 gene or overexpression of mdm2 e.g. a hyperproliferative disorder such as cancer (blood, brain, breast, lung, or a soft tissue cancer) and psoriasis, cf ibrosis, atherosclerosis or restenosis, tumours, colorectal carcinoma cd and chronic myelogenous leukemia. The antisense compound may be cardisense compound reduces hyperproliferation of human cells. The method, which involves the use of the antisense compound, is also useful cor detecting the role of mdm2 expression in various cell functions and chysiological processes and useful in both clinical research and conjugant tools. AAS29242-AAS29507 represent the human mdm2 antisense

                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to antisense compounds, 8-30 nucleobases in length targeted to the 5' untranslated region, translation codon region, 3' untranslated region, coding region or translation start site of a nucleic acid encoding human mdm2, where the antisense compound modulates the expression of human mdm2. The antisense oligonuclectides of the invention are useful for encoding human mdm2 and for inhibiting the expression of human mdm2. They may be used for treating an animal having a disease or condition associated with amplification of mdm2 gene or overexpression of mdm2 e.g. a hyperproliferative disorder such as cancer (blood, brain, breast, lung, or a soft tissue cancer) and psoriasis, fibrosis, atheroselerosis or restenosis, tunours, colorectal carcinoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Homo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    An antisense compound, useful for treating e.g. nucleobases targeted a region (e.g. translation of a nucleic acid encoding human mdm2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human
                                                                                                                                                                                                                                                   and chronic myelogenous leukemia. The antisense compound may be administered with a chemotherapeutic agent to overcome drug resistance. The antisense compound reduces hyperproliferation of human cells. The method, which involves the use of the antisense compound, is also useful for detecting the role of mdm2 expression in various cell functions and physiological processes and useful in both clinical research and diagnostic tools. AAS29242-AAS29507 represent the human mdm2 antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           26-MAR-1998;

The present invention relates to a polynucleotide encoding polymorphic CC Kinase anchor protein (AKAP), with isoleucine residue at position 646 CC replaced with valine, leucine or phenylalanine. AKAP is useful for CC detecting an allelic variant of a human AKAP10 gene which is indicative of an alteration in signal transduction, where the alteration is related CC neurological, neurodegenerative disorders, obesity, diabetes and CC peripheral retinopathies, especially the disorders including Alaheimer's CC disorder and retinitis pigmentosa. The method of the invention is useful for indicating susceptibility to morbidity and/or increased or early CC comprises a nucleotide other than A at position T corresponding to 2073 of AKAP, or a polymorphic region of AKAP10 CC comprises a nucleotide other than A at position T corresponding to position 2073 of AKAP, or a polymorphic region of AKAP10 CC comprises and single-stranded conformation polymorphism analysis, or the detecting step is performed by allele specific hybridisation, primer cc specific extension, oligonucleotide ligation assay, restriction enzyme site analysis and single-stranded conformation polymorphism analysis, or the detection is by detecting a signal group from radioisotopes, enzymes, antipodes, spectrophotometric reagents, chemiluminescent corresponts, fluorescent reagents and other light producing reagents. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polynucleotide encoding polymorphic A-Kinase anchor proteins for detecting an allelic variant of the human gene which is indicative of alteration in signal transduction, and is related to a disorder e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     bipolar; cardiovascular; cardiac; proliferative; neurodegenerative; cardiomyopathy; peripheral retinopathy; obesity; signal transduction left ventricular function; Alzheimer's disease; retinitis pigmentos

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an antisense oligonucleotide compound of 8 to 50 nucleotides in length that is targeted to a nucleic acid molecule encoding caspase 6, where the oligonucleotide specifically hybridises with and inhibits the expression of caspase 6. The oligonucleotide of the invention specifically hybridises to and inhibits expression of caspase 6 in cells or tissues. The oligonucleotides can be administered caspase 6 condition associated with caspase 6, such as Rieger's syndrome or ataxia telangiectasia, hyperproliferative disorder, a haematopoietic disorder, a bone metabolism or cholesterol disorder, a haematopoietic cancer, neurological conditions such as Rieger's disease and other regulated apoptotic pathological conditions. This polynucleotide sequence represents a human caspase 6 oligonucleotide relating to the invention.

NOTE: This phosphorothioate oligonucleotide sequence has 2'-MOE wings and

modulating the expression of human phosphorylase kinase beta. The CC antisense compounds, particularly antisense oligonucleotides, target and cinhibit the expression of human phosphorylase kinase beta. The antisense compounds are useful for inhibiting the expression of human phosphorylase kinase beta in human cells or tissues and for treating an animal, CC particularly a human suspected of having or being prone to a disease or condition associated with expression of phosphorylase kinase beta such as a metabolic disorder e.g. diabetes. The compounds are useful for CC diagnostics, therapeutics and as research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. The CC antisense compounds are useful in the preparation of a pharmaceutical CC formulation. They are highly specific, have an enhanced affinity for the nucleic acid target, and are safely and effectively administered to humans. ABK68888-ABK68965 represent human phosphorylase kinase beta
                                                                                                                            Query Match

                                                                                                                                                                             Ś
                                                                                                                                                                                                                                                                                                                                     The invention relates to a compound 8 to 50 nucleotides in length CC targeted to a nucleic acid molecule encoding a BH3 interacting domain CC death agonist, where the compound specifically hybridises with and CC inhibits the expression of the BH3 interacting domain death agonist. The CC compound of the invention is useful for inhibiting the expression of the CC BH3 interacting domain death agonist in cells or tissues. The compound is CC also useful for treating an animal having a disease or condition CC associated with the BH3 interacting domain death agonist, e.g. CC disorder, immunological disorder, or a disease or condition of the liver CC e.g., hepatitis, or a condition associated with apoptosis. The compound CC is useful for diagnostice, therapeutics, prophylaxis and as research CC reagents and kits. This polynucleotide sequence represents an antisense CC oligonucleotide inhibitor of the DNA from human BH3 interacting domain CC death agonist RNA of the invention. NOTE: This sequence is a chimeric CC oligonucleotide inhibitor of the DNA from human BH3 interacting domain CC oligonucleotide inhibitor of the DNA from human BH3 interacting domain CC oligonucleotide inhibitor. The wings are composed of 2-methoxyethyl (2' hyber nucleotides. The internucleoside (backbone) linkages are pauges are composed of 2-methoxyethyl (2' phosphorothicate (P=S) throughout the oligonucleotide. (Updated on 29-AUG phosphorothicate (P=S) throughout the oligonucleotide.
                                                                                                                                                                                                                                  Query Match

The invention relates to a compound 8 to 50 nucleotides in length CC targeted to a nucleic acid molecule encoding a BH3 interacting domain CC death agonist, where the compound specifically hybridises with and CC inhibits the expression of the BH3 interacting domain death agonist. The CC compound of the invention is useful for inhibiting the expression of the BH3 interacting domain death agonist. The CC also useful for treating an animal having a disease or condition CC associated with the BH3 interacting domain death agonist, e.g. CC disorder, immunological disorder, or a disease or condition CC is useful for diagnostics, therapeutics, prophylaxis and as research CC e.g., hepastitis, or a condition associated with apoptosis. The compound CC is useful for diagnostics, therapeutics, prophylaxis and as research CC eath agonist RNA of the invention. NOTE: This sequence is a chimeric CC diagnocleotide inhibitor of the DNA from human BH3 interacting domain CC death agonist RNA of the invention. NOTE: This sequence is a chimeric CC by five-nucleotides. The intertucleoside is a chimeric CC by five-nucleotides. The intertucleoside is a chimeric CC by five-nucleotides. The intertucleoside (backbone) linkages are CC phosphorothioate (P=S) throughout the oligonucleotide. (Updated on 29-AUG cc. 2003 to standardise OS field)

                                                                                                                                                                             The present invention describes compounds of 8-30 nucleobases antisense to a nucleic acid encoding human or mouse tumour necrosis factor receptor 2 (TNRR2). Also described is a method for inhibiting expression of human or mouse TNFR2 comprising contacting cells or tissues in vitro with one of the claimed compounds. The antisense compounds are used to treat a disease or condition associated with expression of TNFR2. The present sequence represents a human TNFR2 antisense chimeric phosphorothicate oligonucleotide, which is given in the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel method for identifying subjects at risk of developing thrombotic thrombotytopenic purpura (TTP) disease, comprising providing nucleic acid having a disintegrin and metalloproteinase containing thrombospondin 1-like domains 13 (ADAMTS13) gene from a subject, and detecting the presence or absence of one or more variations in the ADAMTS13 gene. The method of the invention has thrombolytic and haemostatic activity. The methods and compositions of the present invention are useful for the diagnosis and treatment of, and/or analysing risks for thrombotic thrombocytopenic purpura. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; thrombotic thrombocytopenic purpura; TTP; disintegrin; metalloproteinase; thrombospondin 1-like domains 13; ADAMTS13; thrombolytic; haemostatic; PCR; primer; RT-PCR; 5' RACE; 3' RACE;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a compound 8-50 nucleobases in length CC targeted to, and which specifically hybridises with a nucleic acid CC molecule encoding HKR1, and inhibits the expression of HKR1. Also CC described: (1) a compound 8-50 nucleobases in length that specifically CC hybridises with at least an 8-nucleobases in length that specifically CC hybridises with at least an 8-nucleobase portion of an active site on a CC nucleic acid molecule encoding HKR1; (2) a composition comprising the CC compound and a carrier or diluent; (3) a method for inhibiting the CC expression of HKR1 in cells or tissues by contacting the cells or tissues do condition associated CC with HKR1 by administering to the animal a therapeutic or prophylactic amount of the compound so that expression of HKR1 is inhibited; HKR1 can be used as CC HKR1 inhibitors. The compound, composition and methods are useful for treating a disease or condition associated with HKR1, such as a CC hyperproliferative disorder, e.g. lung, brain or breast cancer, by CC inhibiting the expression of HKR1. They are also useful in research and CC diagnostics for modulating the expression of HKR1. The present sequence CC represents a human HKR1 chimeric phosphorothoate oligonucleotide having 2'-O-methoxyethyl (2'-MOE) wings and a deoxy gap, which is an antisense CC ligonucleotide used in the inhibition of human HKR1 in an example from the original content of human HKR1 in an example from the inhibition of human HKR1 in an example from the manufacture of the present in the inhibition of human HKR1 in an example from the inhibition of human HKR1 in an example from the inhibition of human HKR1 in an example from the inhibition of human HKR1 in an example from the inhibition of human HKR1 in an example from the inhibition of human HKR1 in an example from the inhibition of human HKR1 in an example from the inhibition of human HKR1 in an example from the conten

The present invention describes a compound (I) 8-50 nucleobases in length carageted to a nucleic acid molecule encoding BCL2-associated X (BAX) CC protein, where the compound specifically hybridises with the nucleic acid compound specifically hybridises with the nucleic acid compound specifically hybridises with at least 8-nucleobase portion cof an active site on a nucleic acid molecule encoding BAX protein. Also compound specifically hybridises with at least 8-nucleobase portion cof an active site on a nucleic acid molecule encoding BAX protein. Also composition comprising (I) and a pharmaceutical carrier crisuses comprising contacting the expression of BAX protein in cells or tissues comprising contacting the cells or tissues with (I); and (3) cc treating an animal having a disease or condition associated with BAX protein is inhibited. (I) has nootropic, neuroprotective, contribution associated with BAX protein, and can be used in antisense therapy, and as a BAX crisusesion of BAX protein, and for treating a disease or condition cassociated with BAX protein, and for treating a disease, Hodgkin's disease, activation and some compounds (I) are useful for modulating the content of BAX protein, and for treating a disease, Hodgkin's disease, activation is disease, activation and some compounds (I) and sease, activation and sease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           antisense therapy; BAX antagonist; BAX inhibitor; familial amylotrophic lateral sclerosis; Alzheimer's disease; Parkinson's disease; Hodgkin's disease; cartilage-hair hyperplasia; diabetes-associated ocular disorder; scrapie infection; aberrant apoptosis; human; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense compounds, useful for modulating the expression of BCL2-associated X (BAX) protein or for treating a disease or condition associated with BAX protein, e.g. Parkinson's disease, Hodgkin's diseases of the condition 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Zhang
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               13-JUL-2002; 2002WO-US022417

The present invention describes a compound (I) that is 8-50 nucleobases in length: (a) targets a nucleic acid molecule encoding major histocompartibility complex (MHC) class II transactivator, and specifically hybridises with the nucleic acid encoding the MHC class II transactivator, and inhibits the expression of MHC class II transactivator, or (b) specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding
                                                                                                                                      New antisense oligonucleotides for modulating MHC class II transactivator gene expression, particularly useful for treating autoimmune disorders such as transplant rejection, Alzheimer's disease, or multiple sclerosis,
                                                                                                                                                                                                                                                                                                  04-DEC-2002; 2002WO-US038616
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Homo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 phosphorothicate;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            nootropic; neuroprotective; immunostimulant; autoimmune disort MHC Class II transactivator inhibitor; infection; transplant; diabetes; rheumatoid arthritis; cancer; Alzhelmer's disease; multiple sclerosis; severe combined immunodeficiency disease;

The MHC class II transactivator condition associated with MHC class II transactivator condition associated with MHC class II transactivator, e.g. condition associated with MHC class II transactivator in condition associated with MHC class II transactivator in condition condition associated with MHC class II transactivator in condition condition associated with MHC class II transactivator in collision of the expression of MHC class II transactivator in collision conditions. In particular, these diseases include transplant conjugate in the condition of the expression of of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                          This invention relates to a novel antisense compounds that modulate expression of oestrogen receptor beta (ERSB). Oestrogen is a steroid hormone that exerts a wide range of effects throughout the human bod being primarily involved in female sexual maturation. Additionally, however, oestrogen targets male reproductive tissues, is known to be important in bone maintenance and plays a protective role in the cardiovascular system. This hormone receptor, ERSB (also known as ER
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MHC class II transactivator. antidiabetic, antirheumatic,
                                                                                                                                                                                                                                                                                                                                                                                             or lymphoma.
                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense oligonucleotides for modulating estrogen receptor beta gene expression, particularly useful for treating cancers, specifically leiomyoma, pancreatic cancer, prostate cancer, breast cancer, bone cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Dobie KW,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  07-DEC-2001; 2001US-00005058

Furthermore, ERSB has been localised to metastatic cells indicating an involvement in cellular proliferation. Accordingly, the selective inhibition of ERSB by the cytostatic antisense oligonucleotides of this invention could provide a therapeutic target for the treatment of cancer, as well as other ERSB-related disorders. This oligonucleotide sequence is the chimeric human antisense oligo used to inhibit expression of human ERSB, the aim of the invention. Note that it has two terminal five nucleotide 2'-methoxyethyl (2'-MOE) wings separated by a ten deoxymucleotide gap. The oligonucleotide backbone is phosphorothioate throughout
                                                     The invention comprises antisense oligonucleotides which are targeted to the human mdm2 gene. The antisense oligonucleotides of the invention are useful for reducing hyperproliferation of human cells. The antisense oligonucleotides are also useful for treating: hyperproliferative disorders (e.g. cancer), psoriasis, fibrosis, atherosclerosis, or restenosis. The antisense oligonucleotides are also useful for modulating apoptosis, and for increasing expression of p21. The present DNA sequence represents a human mdm2 gene antisense oligonucleotide of the invention. The present sequence contains 2'-methoxverthoxv-residence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antisense oligonucleotide; human; mdm2; hyperproliferation; hyperproliferative disorder; cancer; psoriasis; fibrosis; atherosclerosis; restenosis; apoptosis modulation; p21; ss; 2'-methoxy-residue; phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ADD21681 standard; DNA; 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel antisense compound targeted to 5' untranslated region, region, or intron:exon junction of nucleic acid molecule encouseful for treating e.g. cancer, psoriasis or restenosis by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human mdm2

                                                                                                                       the human mdm2 gene. The antisense oligonucleotides of the invention are useful for reducing hyperproliferation of human cells. The antisense oligonucleotides are also useful for treating: hyperproliferative disorders (e.g. cancer), psoriasis, fibrosis, atherosclerosis, or restenosis. The antisense oligonucleotides are also useful for modulating apoptosis, and for increasing expression of p21. The present DNA sequence represents a human mdm2 gene antisense oligonucleotide of the invention. The present sequence contains 2'-methoxyethoxy-residues and has a
                                                                                                                                                                                                                                                                                 Novel antisense compound targeted to 5' untranslated region, region, or intron:exon junction of nucleic acid molecule encuseful for treating e.g. cancer, psoriasis or restenosis by

                                                                                                                                                                                                                                                                                  CC predisposition for or the occurrence of neurodegenerative disease in a cc subject. The method comprises detecting in a target nucleic acid obtained from the subject the presence or absence of an allelic variant of one or more polymorphic regions of one or more genes selected from uPA (Urokinase plasminogen activator), SNCG (gamma-synuclein), IDE (insulince degrading enzyme), KNSL1 (Kinesin-like protein 1), LIPA (lysosomal acid lypase), and TNFRSF6 (Tumour Necrosis Factor Receptor-SF6), where the presence of at least one of the allelic variant of one or more cocurrence of neurodegenerative disease. The genes are all located on chromosome 10. M1 is useful for determining a predisposition for or the occurrence of, and for treating neurodegenerative disease, particularly clinthemetrs disease. The present sequence is a PCR primer, which was used in the method of the invention

This primer was used to isolate cells which are CD31+ CD34+ CD45- CD105+ c-kit-lin-. The isolated cells were used in the composition of the invention which comprises fewer than 20% of lineage committed cells. The composition of the invention is useful for reconstituting haematopoiesis, and therefore in promoting survival, proliferation and/or differentiation of haematopoietic stem cells which may be used in treating cancers (e.g. leukaemia) or in bone marrow transplantation as well as transplantation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A composition for promoting survival, proliferation and/or differentiation of hematopoietic stem cells useful in e.g. bone marrow transplantation, comprises lin cells that express CD31, CD34 and CD105.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ss; primer; molecular phenotyping; brain; lung; CD31+ cell; lineage committed cell; survival; proliferation; differentiation; haematopoletic stem cell; cancer; leukaemia; bone marrow;

                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a compound 8-50 nucleobases in length targeted to a nucleic acid encoding Serum response factor Accessory Protein (SAP)-1 or a splice variant of SAP-1, where the compound specifically hybridizes with and inhibits the expression of SAP-1, a splice variant of SAP-1, or a truncated form of SAP-1, or hybridizes with an 8-nucleobase portion of an active site on a nucleic acid encoding SAP-1. The compound is used for inhibiting the expression of SAP-1 in cells or tissues, and for treating an animal having a disease or condition associated with SAP-1. The disease or disorder is a hyperproliferative disorder, such as breast, prostate or hematopoietic cancer. The antissues compounds may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 modified_base
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     modified_base
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             modified_base
                                                                                                                                                                                                                                                                                                                      used as research reagents and diagnostics, as therapeutics, prophylaxis, to elucidate the function of particular genes, to distinguish between functions of various members of biological pathway, and in treatment regimes of cells, tissues, and animals. This sequence corresponds to an oligonucleotide of the invention which is targeted to the human SAP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       response factor Accessory Protein (SAP)-1, for inhibiting the express of SAP-1 and for treating a disease or condition associated with the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense oligonucleotides targeted to nucleic acid encoding Serum response factor Accessory Protein (SAP)-1, for inhibiting the expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 15; SEQ ID NO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          expression of SAP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Baker BF,

CC immunosuppressive, and cytostatic active agent composition of the invention at a trianglammatory steroid and ubiquinone. A composition of the invention communosuppressive, antiallergic, antiasthmatic, hypotensive, an attinflammatory, antiallergic, antiasthmatic, hypotensive, are composition of the invention communosuppressive, and cytostatic activity. The composition may have a composition are respiratory, lung or malignant disease or condition, also composition are respiratory, lung or malignant disease or condition, also composition for reducing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of or reducing sensitivity to adenosine, reducing levels of adenosine composition, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject stissue, or treating bronchoconstriction, increasing inflammation, lung allergies, or a respiratory disease or condition.

CC Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO are for whom the formation of the printed contribution is presented in the printed contribution.

                                                                                                                                                                                               밁
                                                                                                                                                                                                                           8
                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or CC masal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC immunosuppressive, and cytostatic activity. The composition may have a CC immunosuppressive, and cytostatic activity. The composition may have a CC immunosuppressive, and cytostatic activity. The composition may have a CC for enhancing the prophylactic or therapeutic respiratory effect of an CC antiinflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of adenosine cof or reducing bronchodilation, increasing levels of ubiquinone or CC lung surfactant in a subject tissue, or treating bronchoconstriction, cote: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

ubiquinone

nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO The invention relates to a novel pharmaceutical composition, which has first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or ftp.wipo.int/pub/published_pct_sequences

```
Consistant active agent comprising an oligonucleotide antisense to the contribution relates to a novel pharmaceutical composition, which has a consistant coden, coding region, 5' or 3' end genomic flanking regions, coding region, 5' or 3' end genomic flanking regions, coding a polypeptide associated with lung and/or coding a polypeptide associated with lung and/or codinflammatory, steroid and thiquinone. A composition of the invention code antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cycostatic activity. The composition may have a code in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also code for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosine code, or reducing sensitivity to adenosine, reducing levels of adenosine code, producing bronchodilation, increasing levels of building subject, lung surfactant in a subject, subject, or treating bronchoconstriction, lung surfactant in a subject, or a respiratory disease or condition. Composition in a subject, subject, or a respiratory disease or condition. The sequence data for this patent is not represented in the printed conspication, but was obtained in electronic format directly from WIPO and the printed of the printed of the printed or the printed or the printed of the printed of the printed of the printed or the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy;

                                                                                                                                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                              S
                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory, antiallergic, antiasthmatic, hypotensive, and use in antisense gene therapy. The composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an CC antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of ubiquinone or CC lung surfactant in a subject, tissue, or treating bronchoconstriction, CC lung inflammation, lung allergies, or a respiratory disease or condition. CC specification, but was obtained in electronic format directly from WIPO CC at fig. wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

Human RANTES oligonucleotide sequence.

```
CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of or reducing sensitivity to adenosine, reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of definition. CC lung surfactant in a subject's tissue, or treating bronchoconstriction. CC lung inflammation, lung allergies, or a respiratory disease or condition. CC lung inflammation, lung allergies, or a respiratory disease or condition. CC lung inflammation, but was obtained in electronic format directly from WIPO at figure in the printed constriction, but was obtained in electronic format directly from WIPO at figure is a figure of the sequence data for this patent is not represented in the printed constriction, but was obtained pot sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nyce JW,

CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5 or 3 end genomic flanking regions, CC yand 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an artiinflammatory steeroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine CC enterptor, producing bronchodilation, increasing levels of adenosine CC lung surfactant in a subject's tissue, or treating bronchoonstruction, CC lung inflammation, lung allergies, or a respiratory disease or condition. CC specification, but was obtained in electronic format directly from WIPO at ftp. wipo.int/pub/published_pct_sequences

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure; SEQ ID NO 13257; 872pp; English

The invention relates to a novel pharmaceutical composition, which has a composition relates to a novel pharmaceutical composition, which has a composition codon, coding region, 5' or 3' end genomic flanking regions, coding region, 5' or 3' end genomic flanking regions, coding regions, coding regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or coding a polypeptide associated with lung and/or coding a polypeptide associated with lung and/or coding antiinflammatory steroid and ubiquinone. A composition of the invention code antiinflammatory, antiallergic, antiasthmatic, hypotensive, coding to a manusuppressive, and cytostatic activity. The composition may have a composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also compositing a respiratory, lung or malignant disease or condition, also composition generating the prophylactic or therapeutic respiratory effect of an antialnflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine contractant in a subject, for activity reducing levels of subiquinone or receptor, producing bronchodilation, increasing levels of subiquinone or anniant contractant in a subject of the composition of the composition and contractant in a subject, for reducing levels of subiquinone or anniant contractant co lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                              Ś
                                                                                                                                                                                                                                                                                                                                                                                                             junctions of genes encoding a polypeptide associated with lung and/or caseal airway dysfunction and a second active agent comprising an antianflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of antiinflammatory steroid in a subject, for reducing densine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine lung surfactant in a subject is issue, or treating bronchoconstriction.

initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of cyunctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a cure in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also conformation the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or adenosine receptor, producing bronchodilation, increasing levels of adenosine reducing inflammation, lung allergies, or a respiratory disease or condition. CC lung inflammation, lung allergies, or a respiratory disease or condition. Solve: The sequence data for this patent is not represented in the printed generation, but was obtained in electronic format directly from WIPO or a fer wino int/nub/wiblished not segmences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; antisense; lung dysfunction; nasal airway dysfunction; antiinflammatory; teroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy;

                                                                                                                                                                                                                                                                                                                                                                                                preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing gensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp. wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; antisense; lung dysfunction; nasal airway dysfunction; antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; antisense gene thorapy; respiratory; bronchoconstriction; lung allergy; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Homo sapiens.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure; SEQ ID NO 14304; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a cfirst active agent comprising an oligonucleotide antisense to the cinitiation codon, coding region, 5' or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions, 6' or and 3' intron-exon junctions, or regions within 2-10 nucleotides of cymctions of genes encoding a polypeptide associated with lung and/or comparison and a second active agent comprising an capture antiinflammatory steroid and ubiquinone. A composition of the invention capture in antisense gene therapy. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also capture in a subject, for reducing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosine capturing a respiratory to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of bulguinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, continuing antiflammation, lung allargies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at the manner of the printed capture in the printed specification, but was obtained in electronic format directly from WIPO at the manner of the printed capture in the printed specification. ftp.wipo.int/pub/published_pct_sequences

cc mass airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention chas antiinflammatory, antiallergic, antiasthmatic, hypotensive, cc immunosuppressive, and cytostatic activity. The composition may have a composition may have a composition are spiratory, lung or malignant disease or condition, also cc for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of or reducing sensitivity to adenosine, reducing levels of adenosine ceeptor, producing bronchodilation, increasing levels of adenosine colung surfactant in a subject's tissue, or treating bronchoconstriction. Cc lung inflammation, lung allergies, or a respiratory disease or condition. Cc lung inflammation, lung allergies, or a respiratory disease or condition. Cc lung inflammation, but was obtained in electronic format directly from WIPO cc at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nyce JW,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel pharmaceutical composition, which has a cc first active agent comprising an oligonucleotide antisense to the crimitiation codon, coding region, 5' or 3' end genomic flanking regions, cc initiation codon, coding region, 5' or 3' end genomic flanking regions, cc finitiation codon, coding a polypeptide associated with lung and/or cc antiinflammatory steroid and ubiquinone. A composition of the invention cantiinflammatory steroid and ubiquinone. A composition may have a cc use in antisense gene therapy. The composition is useful for treating or cc preventing a respiratory, lung or malignant disease or condition, also cf or enhancing the prophylattic or therapeutic respiratory effect of an cr reducing sensitivity to adenosine, reducing levels of adenosine cc lung surfactant in a subject, for readucing levels of denosine or clung surfactant in a subject of tissue, or treating bronchoconstriction. Surfactant, lung allergies, or a respiratory disease or condition, but was obtained in electronic format directly from WIPO can be sequenced and the printed of the printed or the

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

Disclosure; SEQ ID NO 5086; 872pp; English

cy junctions of gene encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention cantiinflammatory, antiallergic, antiasthmatic, hypotensive, has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a constitution of the invention of the invention of the invention of the prophylactic or therapy. The composition may have a preventing a respiratory, lung or malignant disease or condition, also containflammatory steroid in a subject, for reducing or depleting levels of an antiinflammatory steroid in a subject, for reducing or depleting levels of confort, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine confort inflammation, lung allergies, or respiratory disease or condition. CC lung surfactant in a subject's tissue, or treating bronchoconstriction, content of the sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO appears to the printed of the printe The invention relates to a novel pharmaceutical composition, which has first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, initiation codon, coding region, 5' or 3' end genomic flanking regions 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of upiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, increasing the procession of the prophylactic stissue, or treating bronchoconstriction, and infinity in the large or a respiratory disease or condition.

```
CC first active agent comprising an oligonucleotide antisense to the cinitiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive, CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an CC antiinflammatory steroid in a subject, for reducing or depleting levels of of, or reducing sensitivity to adenosine, reducing levels of adenosine caceptor, producing bronchodilation, increasing levels of ubiquinone or CC lung inflammation, lung allergise, or a respiratory disease or condition. CC Note: The sequence data for this patent is not represented in the printed of a precification, but was obtained in electronic format directly from WIPO at frem wino information accounts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nyce JW,
